

Project Overview

PROJECT NAME:

Disease project: Orthorine Aminotransferase Deficiency

GENERAL OBJECTIVE:

Comprehend Orthorine Aminotransferase deficiency from a genetic, biological and molecular point of view. Such that we are able to understand its causes, the changes it produces and the consequences on the biochemical processes and phenotypes of affected individuals.

SPECIFIC OBJECTIVES:

1. Define what Orthorine Aminotransferase is, including its functions, characteristics, localization, structure and sequence.
2. Compare the sequence alignment of wild-type OAT with the mutant variants, analysing the causes of the differences and the consequences on the protein structure and functions
3. Compare the homologs of OAT found in humans with two other non-human species and identify the similarities and variations
4. Learn how to use the software platform GitHub and familiarize ourselves with the websites
5. Optimize the use of a Gantt chart in order to guarantee an efficient work flow and equitable weight of responsibilities for each member of the group.

MILESTONES:

M1: Project scope, overview and objectives defined

M2: Create an updated and completed database research

M3: Establish the analysis and interpretation of OAT and its variants

M4: Final project revised and competed

PROJECT MEMBERS:

Roger Mena López (Bioinformatics Bachelor's degree student, UPC)

Data analyst:

Investigate and interpret biological mechanisms; evaluate scientific evidence and its relevance to the research question; communicate conclusions and their implications to the team.

Ana Sánchez Rebollo (Bioinformatics Bachelor's degree student, UPC)

Developer:

Contribute to the development of the project's tasks; perform the scientific work required by the project; analyse and interpret information; communicate progress and problems; ensure that all contributions meet the quality standards.

Veronica Wangchen (Bioinformatics Bachelor's degree student, UPC)

Project Manager:

Facilitate the team's Agile workflow; coordinate communication between team members; monitor progress and help the team meet deadlines; organise meetings and follow-ups when necessary; review and accept completed deliverables.

Clara Jiménez Bernal (Bioinformatics Bachelor's degree student, UPC)

Project Owner:

Define and communicate the project's objectives and scopes; decide and prioritise what needs to be done; make sure the project stays focused on its main goal; clarify requirements when needed; and ensure that the final project meets the agreed requirements.
